

?Permissions in Rust

Some plugins may require permissions to use, you can manually give users permissions by running:

```
oxide.grant user <steamid> <permission>
```

To remove a permission from a user you can run

```
oxide.revoke user <steamid> <permission>
```

Or you can grant an entire group (more practical)

```
oxide.grant group default <permission>
```

Creating & managing groups

Create a group

```
oxide.group add <groupName>
```

Remove a group

```
oxide.group remove <groupName>
```

Add a user to a group

```
oxide.usergroup add <steamid> <groupName>
```
